

CTUIL Compliance Validator

.EXE FILE USERGUIDE

Overview

CTUIL Compliance Validator is a desktop application that validates document references in a CTUIL Compliance Validation Excel workbook against the submitted folders and ZIP files. It generates a new workbook with **Yes/No** validation results for each document reference.

How to Use

1. Launch **CTUIL Compliance Validator.exe**.
2. Select the **Compliance Workbook (.xlsx)**.
3. Add one or more **Submission Folders** and/or **ZIP Files**.
4. Choose the **Output Workbook** location (or use the default suggested path).
5. Click **Start Validation**. Open in full Dialogue box if button not visible.

The application will scan all selected files, validate the document references, and generate a validated Excel workbook.

Output

The generated workbook includes:

- A validation column beside each detected filename/document column.
 - **Yes** if all referenced files are found.
 - **No** if one or more referenced files are missing.
 - Optional comments showing matched and missing file paths (unless **No Comments** is selected).
-

Notes

- Supports multiple folders and ZIP files.
 - Supports nested ZIP files.
 - Original workbook is not modified.
 - A new validated workbook is created at the selected output location.
-

Requirements

- Windows 10 or later

- Microsoft Excel workbook (.xlsx)
 - No Python installation is required to run the executable.
-

SOURCE CODE USERGUIDE

Install

```
cd "C:\Users\yourUsername\Desktop\CTUIL\1 My Work\Compliance Sheet  
Verifier\ComplianceValidator"  
py -m pip install -r requirements.txt
```

Run to open GUI

```
py gui.py
```

Run main.py with below command prompt to validate from Terminal without GUI

```
py main.py "..\CON4_Compliance_Validation_Sheet.xlsx" "..\Folderpath" -o  
"..\CON4_Compliance_Validation_Sheet_validated.xlsx"
```

You can pass multiple search roots:

```
py gui.py
```

For running main.py without GUI:

```
py main.py "..\CON4_Compliance_Validation_Sheet.xlsx" "D:\SubmissionFolder"  
"D:\Submission.zip"
```

What It Does

- Scans folders, zip files, and nested zip files.
- Detects filename-like headers across all workbook sheets, even when columns are hidden or located at different positions.
- Handles examples such as File Name(pdf) , File Name(PSSE/PSCAD) , Document Name , Name of File/ Folder Name , and Ref Document Name .
- Matches case-insensitively and supports:
 - filename.extension
 - folder\filename.extension
 - folder\filename
 - filename
- Adds one Found? - <header> status column beside each detected filename column.

- Writes `Yes` only when all references in that cell are found; otherwise writes `No`.
- Adds comments showing matched and missing paths unless `--no-comments` is used.
- Adds Remarks column showing matched and missing paths.

Use `--dry-run` to check detected columns without writing an output workbook.
